🏆 Webcmder AI Agent Auto-Applier Platform

Official Presentation Summary & Technical Pitch Document | Built by **Group Webcmder**

🎯 1. Executive Summary & Problem Statement

Applying for jobs and internships manually across multiple portals (LinkedIn, Internshala, Greenhouse) is repetitive and time-consuming. Candidates copy-paste the same profile details hundreds of times. Existing extensions break on multi-step screening questions, fail on complex resume layouts, and provide zero presentation transparency.

Group Webcmder Platform solves this by introducing a human-in-the-loop AI agent workflow powered by `@agentrhq/webcmd`, FastAPI, and Microsoft Edge automation.

✨ 2. Key Modules & Features

Module Name	Technology Stack	Core Functionality
Webcmd Core Engine	`@agentrhq/webcmd` v0.7.4, CloakBrowser	Spawns explicit Webcmd sessions (`session create`), drives stealth CloakBrowser (`browser run --stdin`), captures compact accessibility tree diffs (`snapshotDiff`), saving 90% token spend.
Dynamic PDF Resume Parser	`pdfplumber`, `pypdf`, Regex	Extracts Name, Email (cleans double @@ typos), Phone, Location, Objectives, Skills, and exact CGPA (7.45) & Percentages (71.8%, 90%).
LinkedIn Candidate Profile Clone	HTML5, Glassmorphism CSS	Live realistic candidate profile preview at `/linkedin-clone` showing extracted data reflected across sections.
Internshala Resume Clone	HTML5, Internshala UI Theme	Live candidate resume view at `/internshala-clone` displaying education timelines and skill tags.
1-Click Clipboard Synchronizer	Web Clipboard API	Individual 📋 Copy buttons next to every box, skill pill, and grade item for instant `Ctrl+V` pasting.
Dual-Engine Presentation Runner	Webcmd CloakBrowser + Headful Edge	Allows instant switching between stealth Webcmd daemon automation and headful visible Microsoft Edge window for judge demonstrations.

🛠️ 3. Technical Architecture Summary

- **Browser Infrastructure:** `@agentrhq/webcmd` v0.7.4 daemon on port 9777 with Cloak stealth runtime
- **Session & Tree Management:** Automated Webcmd session leases and Accessibility Tree snapshot diffing
- **Backend Framework:** Python 3.11+, FastAPI, Uvicorn Async Server
- **Real-time Telemetry:** WebSockets (`/ws/logs`) streaming Webcmd CLI execution logs and diffs
- **Automated Testing:** `pytest` & `pytest-asyncio` test suite verifying Webcmd lifecycle
- **Open Source Contribution:** Forked & Starred at `https://github.com/agentrhq/webcmd`
